Platform Component PC-299

Product Specification Sheet · Lab 4 demo document (fictional product)

1. Overview

The Platform Component PC-299 is a containerised service module for internal developer platforms. It ships as an OCI image and runs on any Kubernetes 1.30 or later cluster. It exposes a REST API on port 8121 and a health endpoint at /health for readiness and liveness probes.

2. Technical specifications

Attribute	Value
CPU request / limit	100m / 500m
Memory request / limit	128Mi / 256Mi
Default port	8121
Storage	SQLite on a 1Gi persistent volume
Supported architectures	amd64, arm64
Max upload size	20 MB per PDF attachment

3. Pricing and stock

List price is USD 299.00 per unit. Volume discounts of 10 percent apply from 50 units. Standard stock level is 5 units; lead time for backorders is 14 working days.

4. Warranty and support

PC-299 includes a 24-month limited warranty covering defects in the container image and documented API behaviour. Support is available Monday to Friday, 9:00 to 18:00 Malaysia time (UTC+8), with a 4-hour first response target for severity 1 incidents.

5. Security and compliance

Credentials are injected through Kubernetes Secrets and never baked into the image. Passwords are stored as bcrypt hashes. The image is scanned for CVEs on every build, and a software bill of materials (SBOM) is published with each release.

6. Known limitations

Because the default database is SQLite, the deployment must run a single replica. To scale horizontally, switch DATABASE_URL to PostgreSQL. Scanned PDFs without a text layer are stored but not searchable until OCR is added.
